## Overview

This document provides the details necessary to implement a UI application capable of managing the media stored on the Russound Media Players; the Russound SMS3, iBridgeDock and iBridgeBay. It presents a specific implementation model, similar to the Russound UNO-TS2 Touchscreen keypad. The advantage to this approach is that it allows a UI to mimic the UNO-TS2 state and navigation behavior with minimum effort.

### Implementation Steps

This document presents a 3-step process in implementing support for Russound RNET Media Management.

#### 1. Create Screen Templates

First, create a set of UI screens that contain the required elements (buttons and text fields) necessary to navigate and select on-screen items.

#### 2. Add RNET messages to UI button elements

Next, insert the pre-defined RNET messages to be transmitted upon button press.

#### 3. Parse incoming RNET messages

Finally, create an RNET message parser to extract the menu item text from data messages and initiate screen transitions based on RNET event messages.

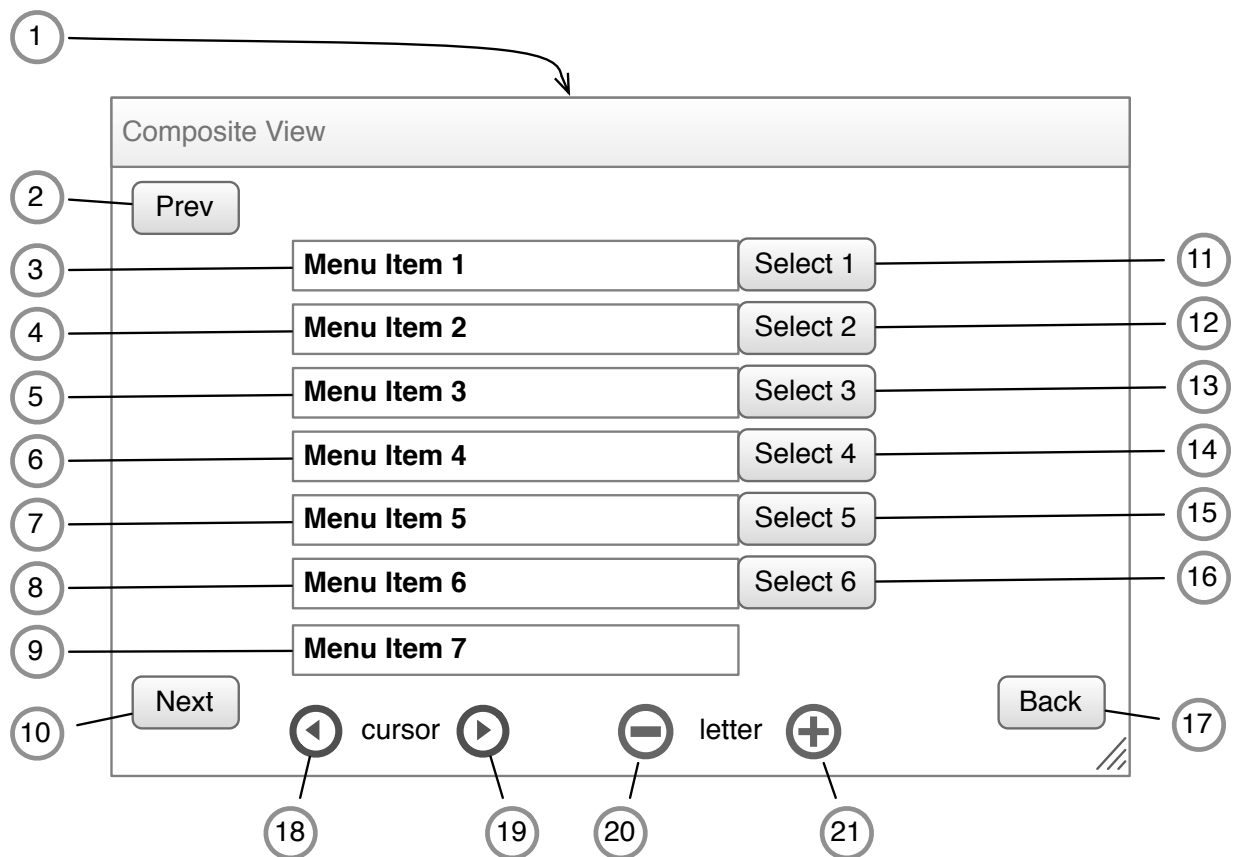

## Background

In order to understand the basics of RNET integration, it is recommended that you review the ***Russound Controller RS232 Protocol*** document. This is available as part of the ***Russound Third Party Development Toolkit*** and available in the Document Center at <http://www.russound.com>. This zip file also contains tools for RNET message generation and analysis. You may find these tools useful during the implementation and testing of your Media Management UI screens.

## Screen Templates

There are two unique sets of screen templates. The first set, made up of 11 screen templates, is defined for managing media on the **Russound iBridge Dock** and **Russound iBridge Bay** RNET source devices. The second set, made up of 10 screen templates, is defined for managing media on the **Russound SMS3 RNET** source device.

There are 21 screen templates in all. These screen templates share a set of screen *elements*. The diagram shown below serves as a 'composite' screen. It is intended to present every screen *element* used across all screen templates. It is important to note that this composite is not part of the necessary set of screen templates that must be implemented. That is, there is no need for a 'composite' screen on your device. It merely serves to present all screen elements on a single diagram and identifies each screen element with a unique reference number for identification, shown in a circle attached to each element, in later sections of this document.

There are 3 types of screen elements:

- **Buttons** - Each button screen element, when pressed by the user, must generate a specific RNet Event Message that is sent to a Russound Master Controller via it's RS232 connection.
- **Menu Items** - These elements are intended to display text derived from special RNet Data Messages received from an RNet source device.
- **Screen Transition** - These are 'hidden' (not visible to the user) elements, responsible for initiating screen transitions based on the state of the media management session.

It is ***important*** to note that this document presents only the screen elements that are specific to implementing the Media Management capability of the Russound RNET devices. In their final implementation, a screen template may contain other screen elements that complement the overall UI design.

The RNet messages associated with these screen elements are presented in the sections presented later in this document.

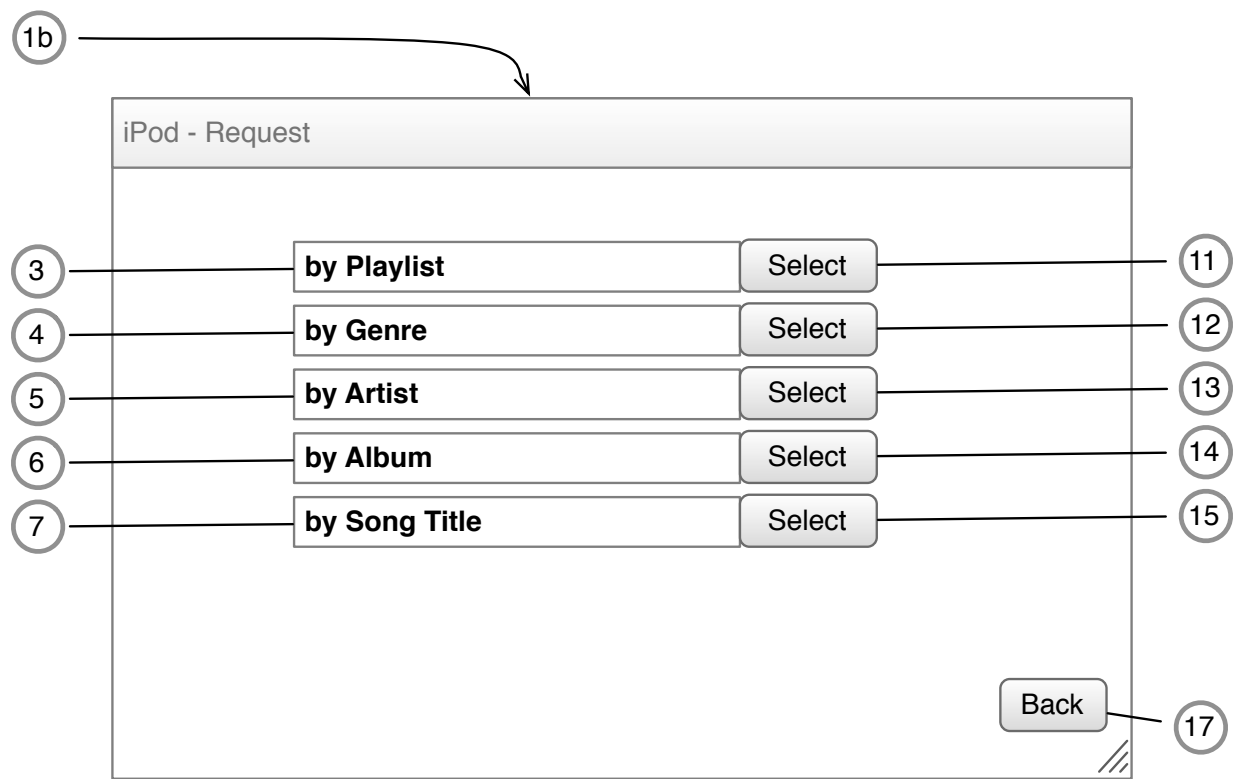

## iBridge Dock/ iBridge Bay Screen Templates

### iPod Now Playing

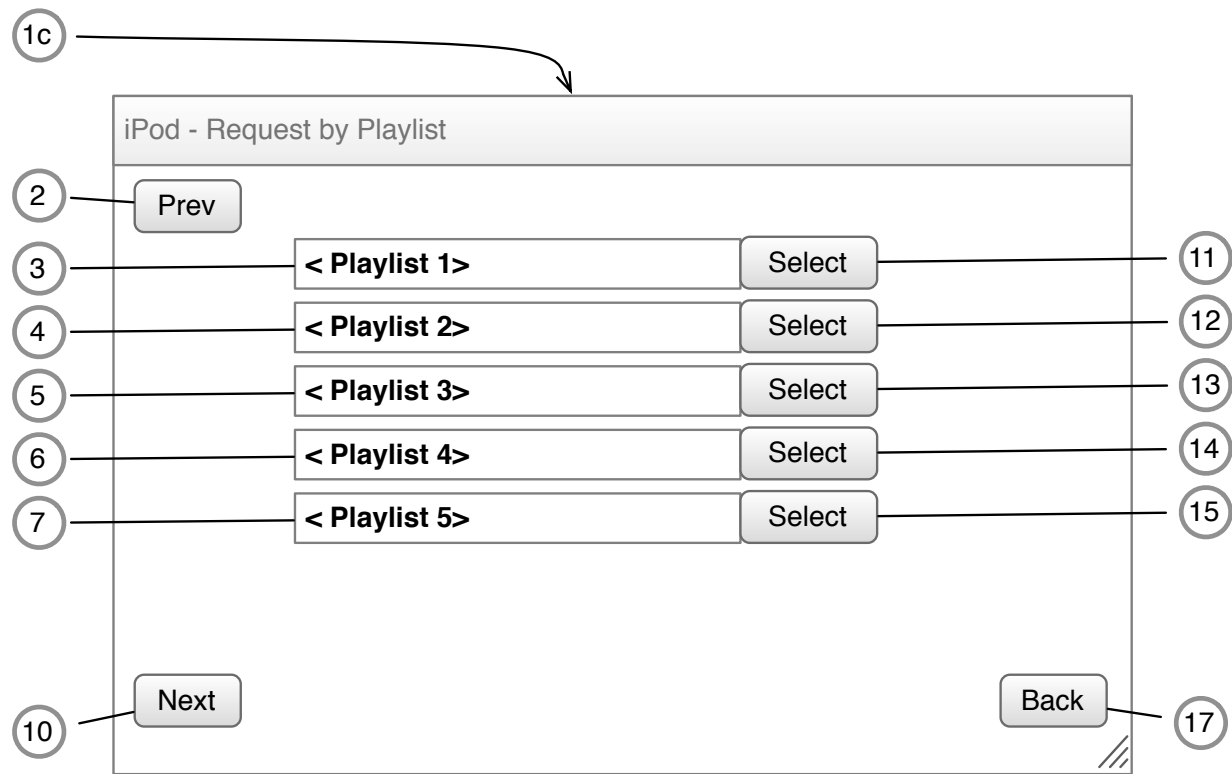

This screen provides entry into the iPod Media Management screens. pressing the 'Music' button will inform the RNET system to transition to the iPod Request screen, populate the Screen Menu Items with the relevant text, and wait for further user-initiated events (button presses).

## User-Initiated Events

This section presents the RNet messages that are to be transmitted by the 3rd party device in response to user button presses. Each section title refers to an item in the Composite Screen shown earlier.

### Prev Button Press (Composite Screen Item 2)

This RNet message is to be transmitted by the 3rd party device when the user presses the 'Prev' button.

## Menu Item Messages

This section presents the RNET messages that are sent by the RNET system and contain the text for each Menu Item displayed on the current screen.

### Menu Item 1 (Composite Screen Item 3)

This RNet message is received by the 3rd party device to indicate that new text must be displayed in the menu item text field.

Byte #	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	...	n-2	n-1	n

**cc** = controller number -1

**zz** = zone number -1

**ss** = source number -1

**tt** = text string

**xx** = checksum

### Menu Item 5 (Composite Screen Item 7)

This RNet message is received by the 3rd party device to indicate that new text must be displayed in the menu item text field.

Byte #	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	...	n-2	n-1	n

## Screen Transitions

This section presents the RNET messages **received by** the 3rd party device to indicate that a new screen template must be displayed. This RNET message is typically followed by a series of RNET messages containing text, used to populate the text fields within the screen to be displayed.

### SMS3 Now Playing Screen Select (Composite Screen Item 1a)

This RNet message is received by the 3rd party device to indicate that the 'SMS3 Now Playing' screen template must be displayed.

Byte #	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23
